

41. CHANGING THE ORIGINAL REPOSITORY

Goals

- To make changes to the original repository so we can try to pull the changes

Make a change in the original **hello** repository

RUN:

```
cd ../hello
# (You should be in the original hello repository now)
```

NOTE: We are now in the repository *hello*

Make the following changes to the README file:

FILE: README

```
This is the Hello World example from the git tutorial.
(changed in original)
```

Now add and commit this change

RUN:

```
git add README
git commit -m "Changed README in original repo"
```

Next

Now the original repo has more recent changes that are not included in the cloned version. Next we will pull those changes across to the cloned repo.
