

50. PLACING YOUR GIT REPOSITORY

Goals

- To learn how to configure git server for sharing repos.

There are different ways to share git repository on the network. Here's the quickest way.

Run git server

RUN:

```
# (From the work directory)
git daemon --verbose --export-all --base-path=.
```

Now, go to your working directory in a separate terminal window.

RUN:

```
# (From the work directory)
git clone git://localhost/hello.git network_hello
cd network_hello
ls
```

You will find a copy of the hello project.

Sending to Git Daemon

If you want to move to the repository Git Daemon, add `--enable=receive-pack` tag to git daemon command. Be attentive, this server does not perform authentication, so anyone can submit changes to your repository.
